How to add a readme when creating a repository in github

1. First click on the "+" button in the top navigation bar
2. Next click on the "New repository" option from the dropdown menu
3. Use the “Owner” dropdown menu to select the account that will own the repository
4. Enter the repository name in the “Repository name” field
5. Enter a description in the “Description” field if needed
6. Click on the visibility dropdown menu in the repository configuration section
7. Then, select Public or Private from the visibility options
8. Toggle on “Add a README file” to include a README
9. Optionally add a .gitignore file and select a license
10. Finally click on the "Create repository" button at the bottom of the form

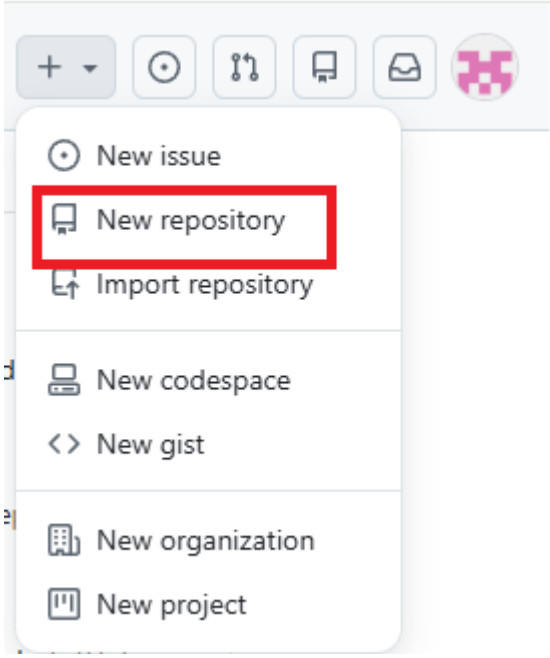
Step 1: Objective:

1. Add a GitHub repository
2. Create and edit a file in the repository
3. Upload and commit a file to the repository

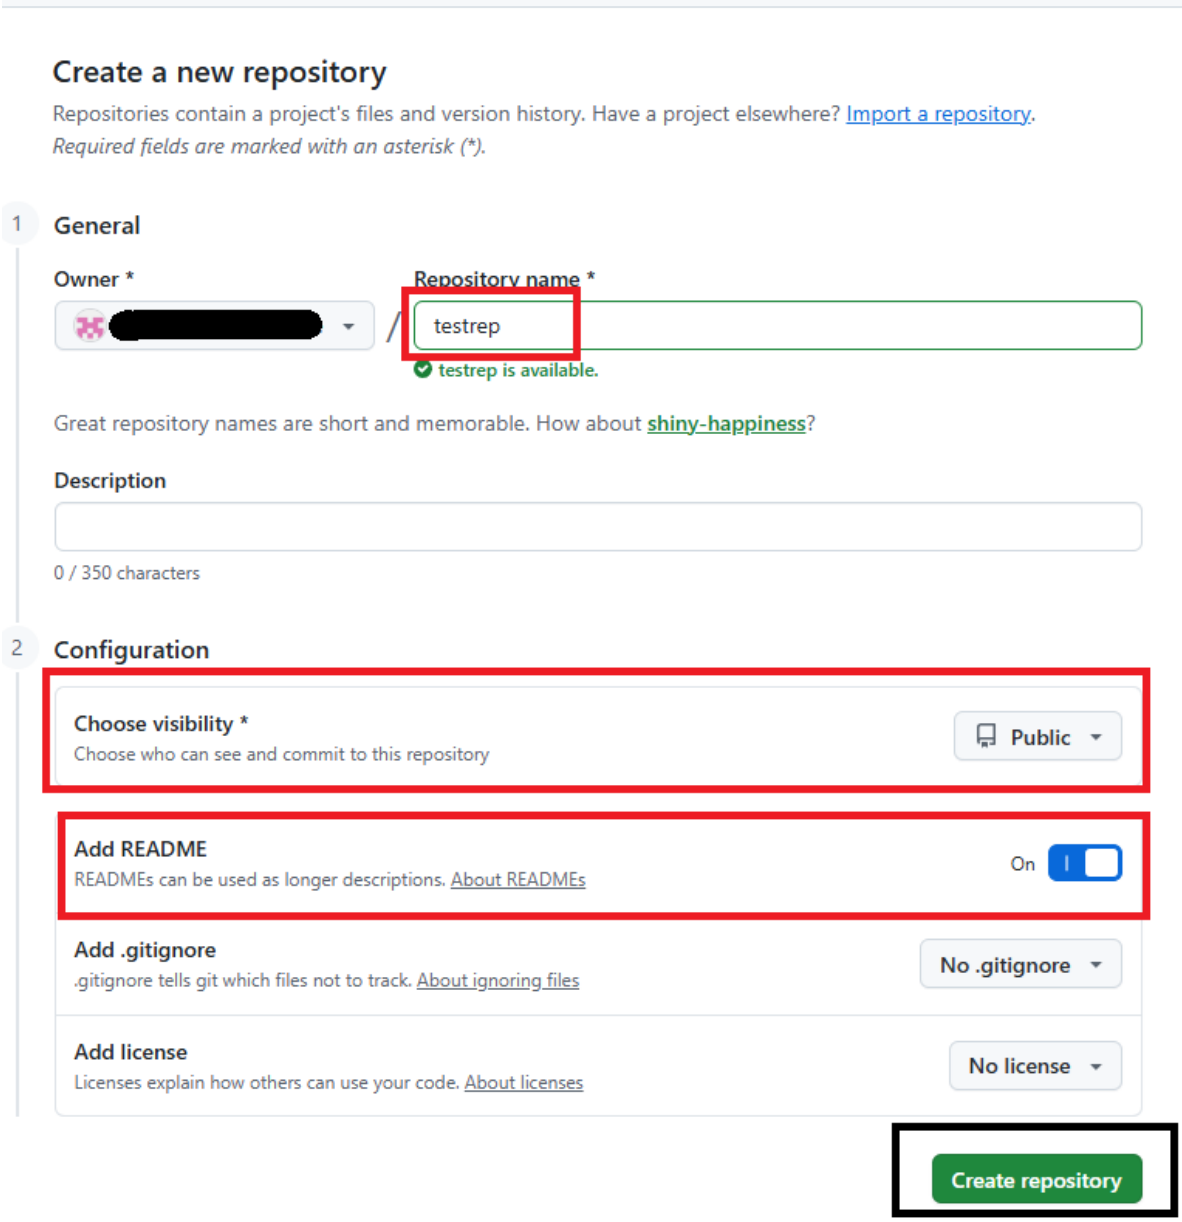
1: Add a GitHub repository

To add a new repository, complete the following steps:

1. At the top right of the GitHub home page, click on the “+” icon and select **New repository**.



2. Enter a repository name and select the **Initialize this repository with a README** check box.



3. Click **Create repository**. The repository is created and its home page is displayed.

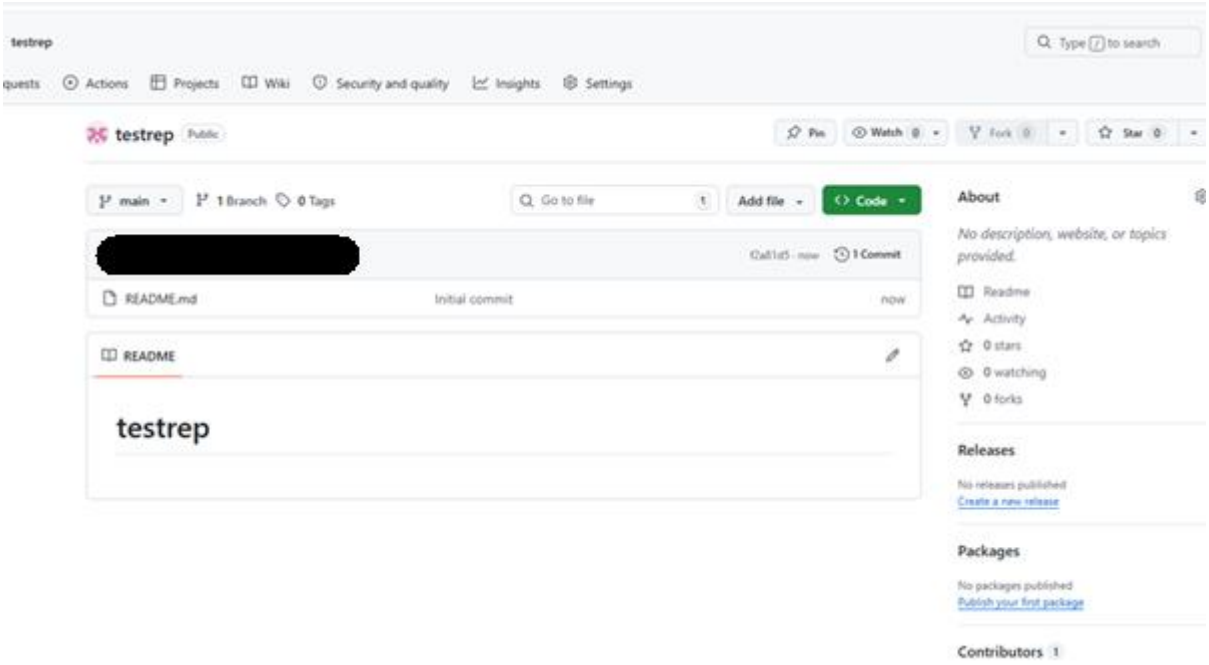
Next, you'll start editing the repository.

2: Create and edit a file in the repository

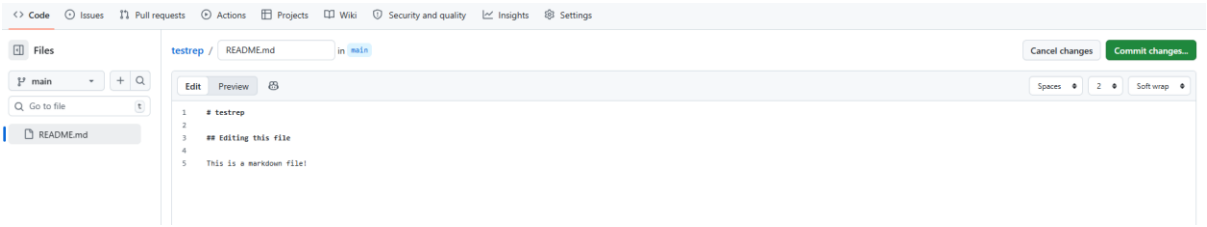
Edit a file

Although you will normally create a file before you edit it, in this case the `README.md` file has already been created for you. To edit that file, complete the following steps:

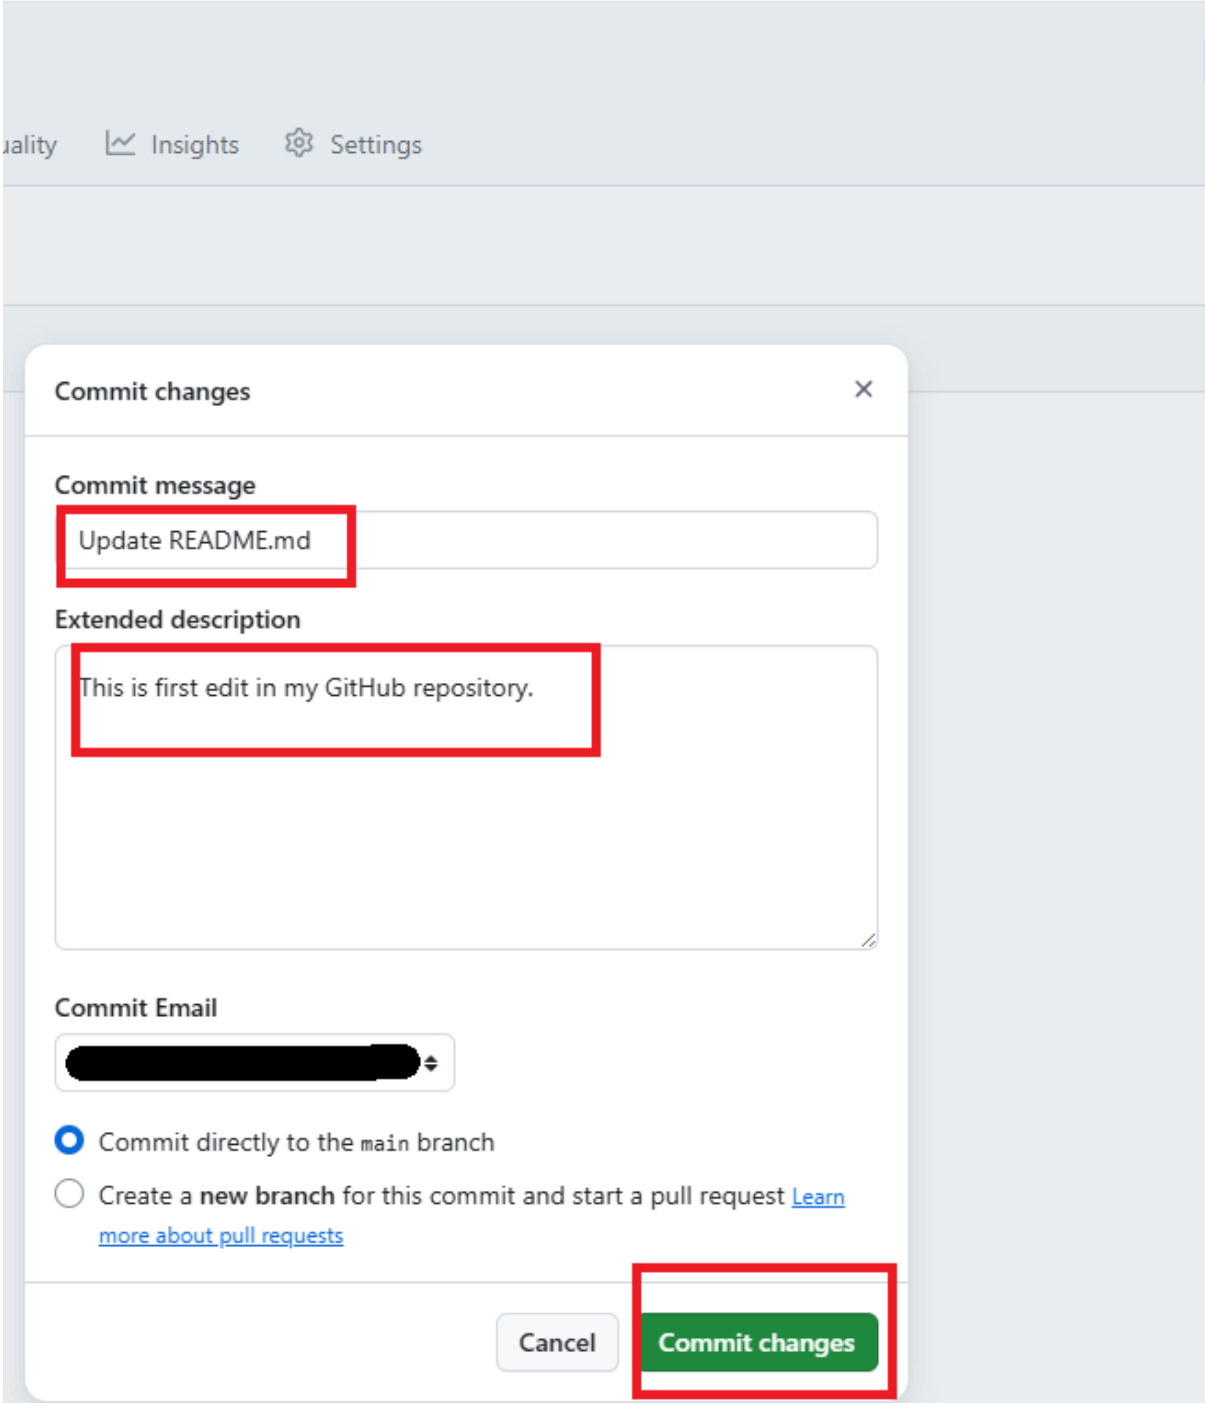
1. Your repository root folder contains just one file: `README.md`. Click the pencil icon at the right to edit the file.



2. Add some text to the file.



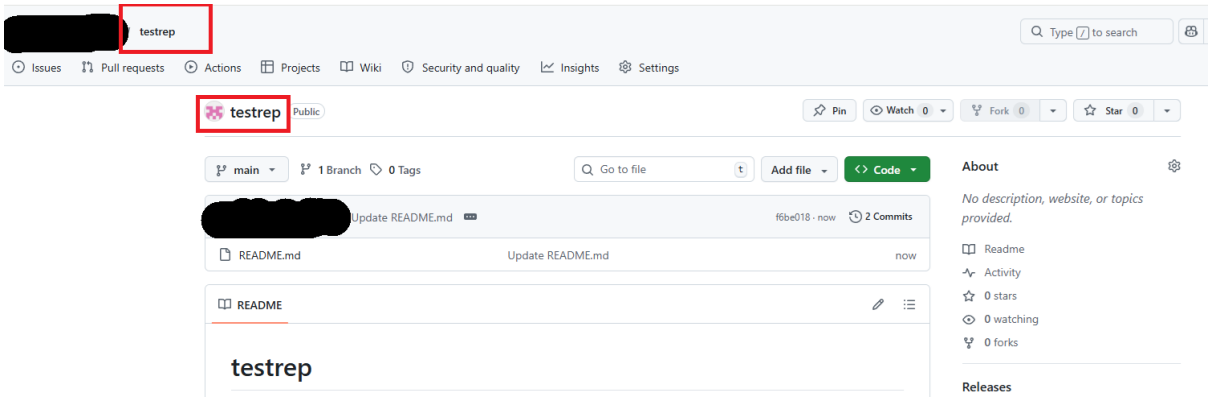
3. Scroll to the bottom of the file and click **Commit changes**.



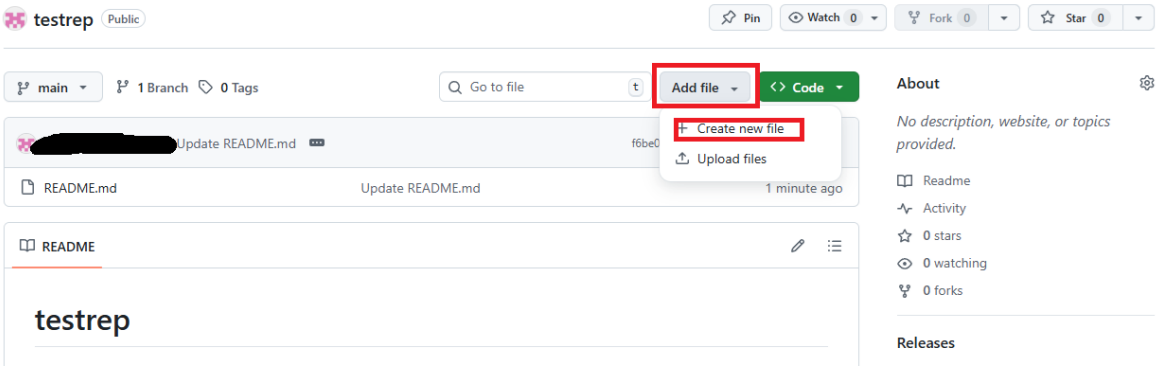
4. Confirm that the text you added to the file has been saved.

Create a new file

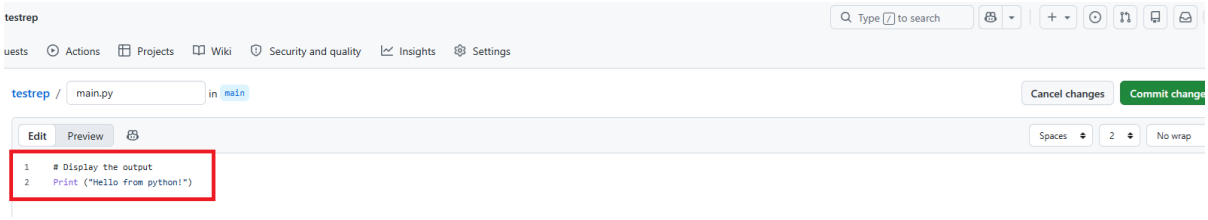
1. Click on the repository name to go back to the main branch, similar to this repository called `testrepo`.



2. Click **Add file** and select **Create new file** to create a new file in the repository.

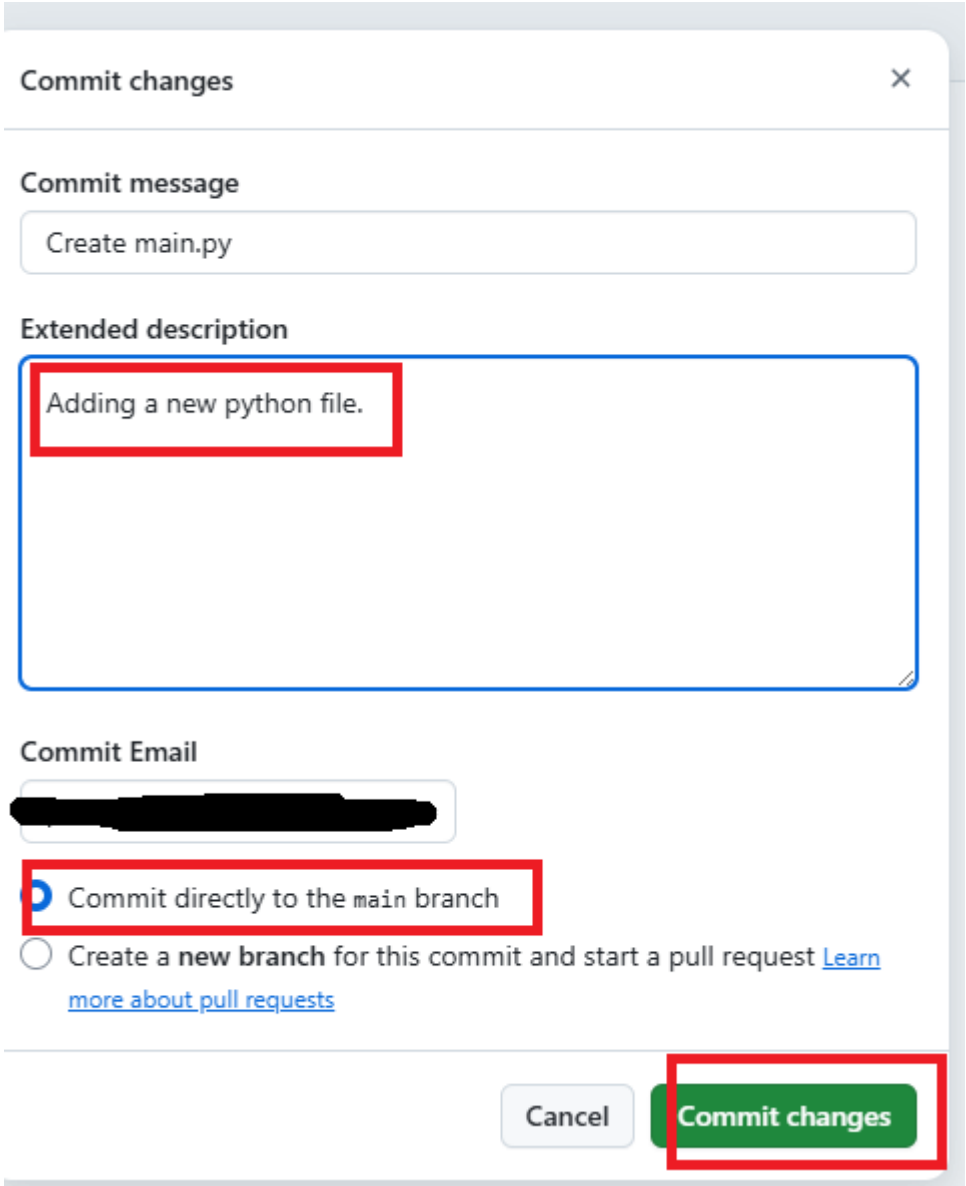


3. Enter a file name and extension; for example, `main.py`. Add the lines of code displayed in the following image to your file:

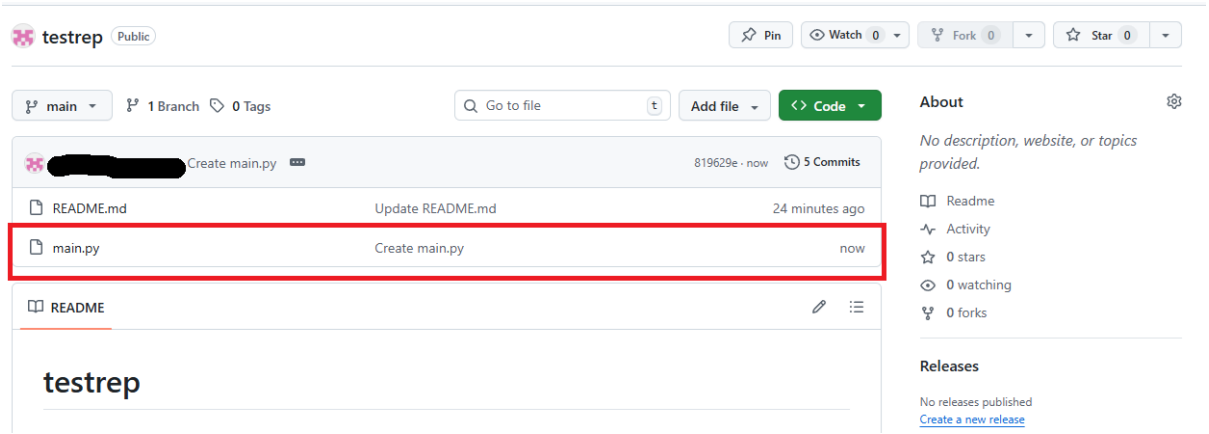


4. Scroll to the bottom of the page. You can optionally add a description of your update (for example, "Adding a new file"). Click **Commit new file** to create your new file.

Commit new file



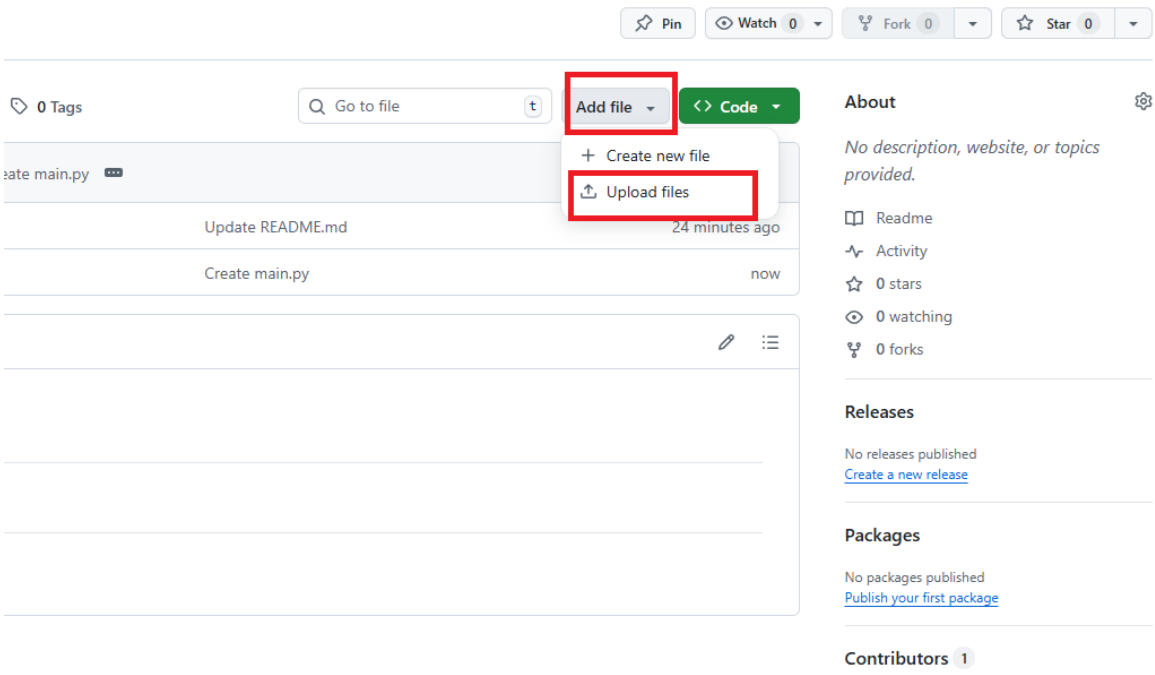
Your file is now added to your repository and the repository listing shows when the file was added or last revised.



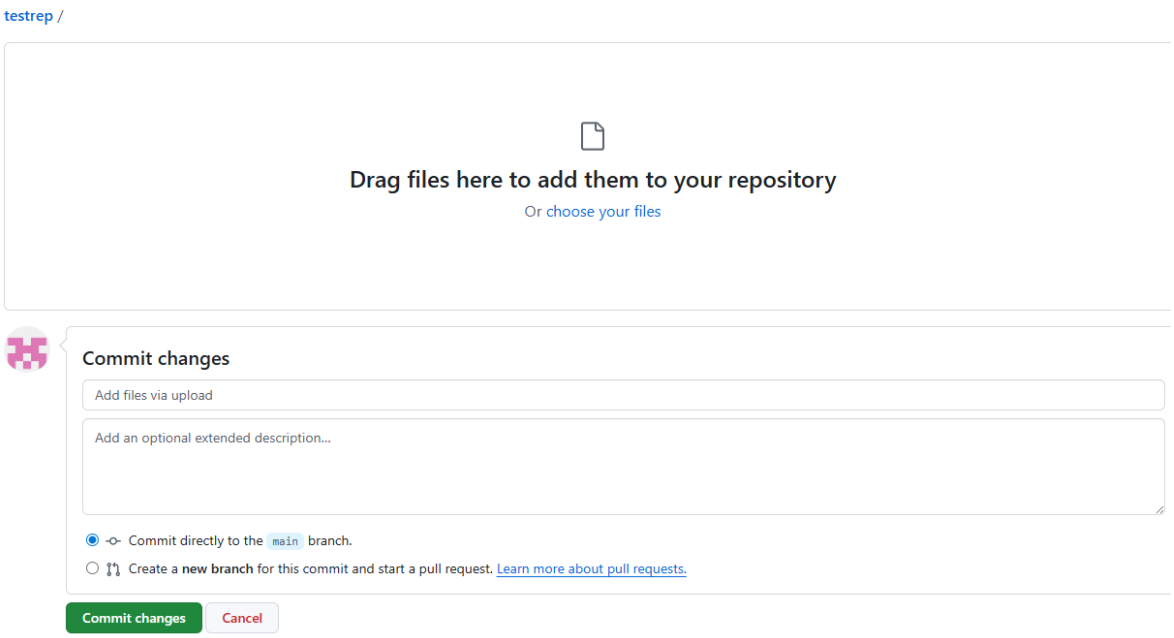
3. Upload and commit a file to a repository

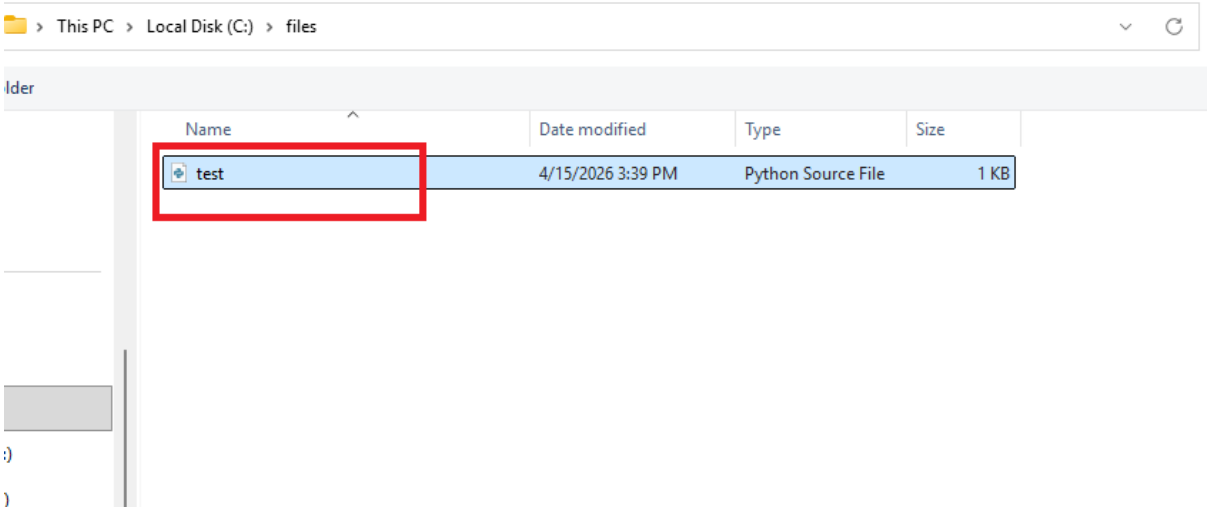
To upload a local file and commit it to your repository, complete the following steps:

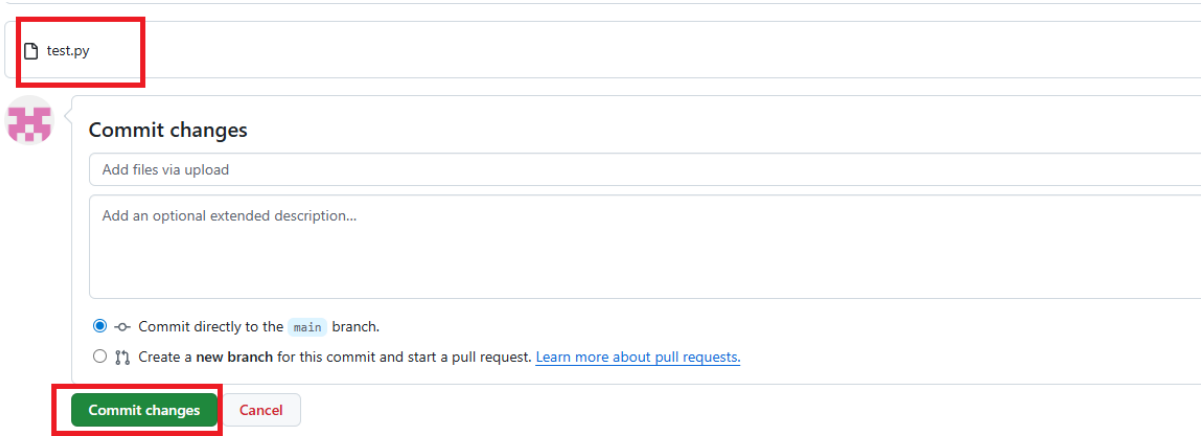
1. On your repository page, click **Add file** and then select **Upload files** to upload a file.



2. Click **choose your files** and choose a file from your computer. You can upload any file (for example, a .txt, .ipynb, or .png file) to the repository.

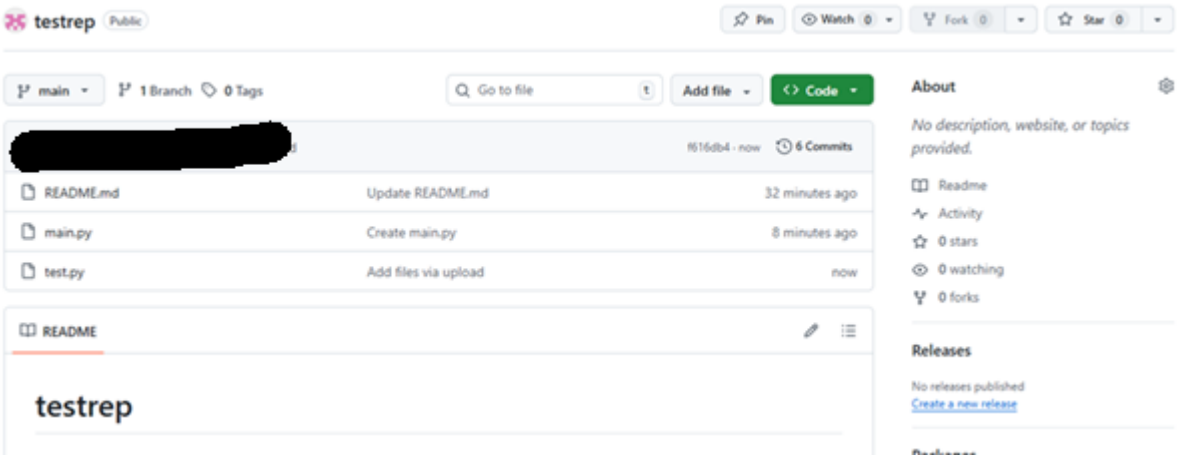






3. When the file finishes uploading, click **Commit changes**.

Your file is uploaded in the repository.



You have learned how to create a new repository, add a new file, edit a file, upload a file, and commit your changes. Continue to update

your repository using these steps to become familiar with the processes that you have learned.

Step 2: Objective:

1. Create a branch

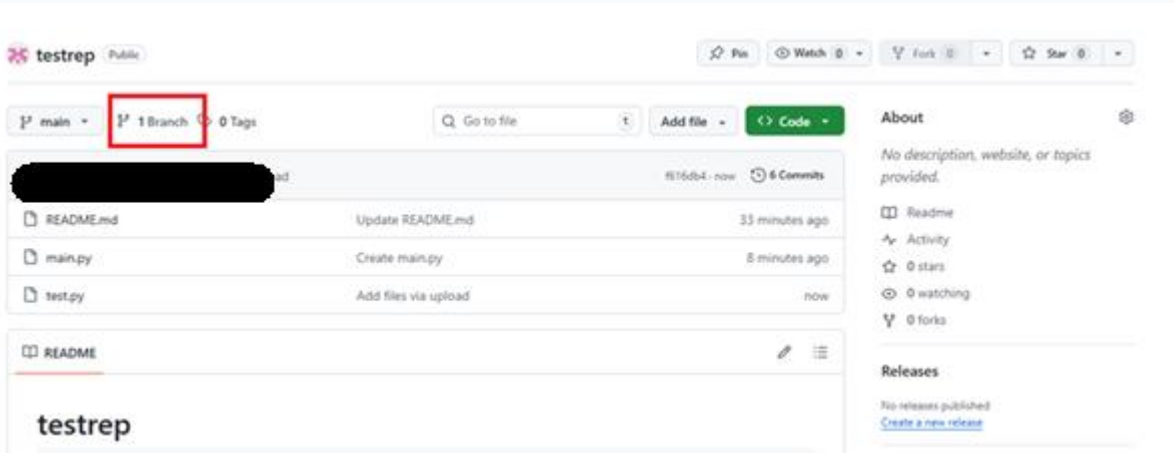
2. Add a feature branch

3. Open a pull request

4. Merge the pull request into the main branch

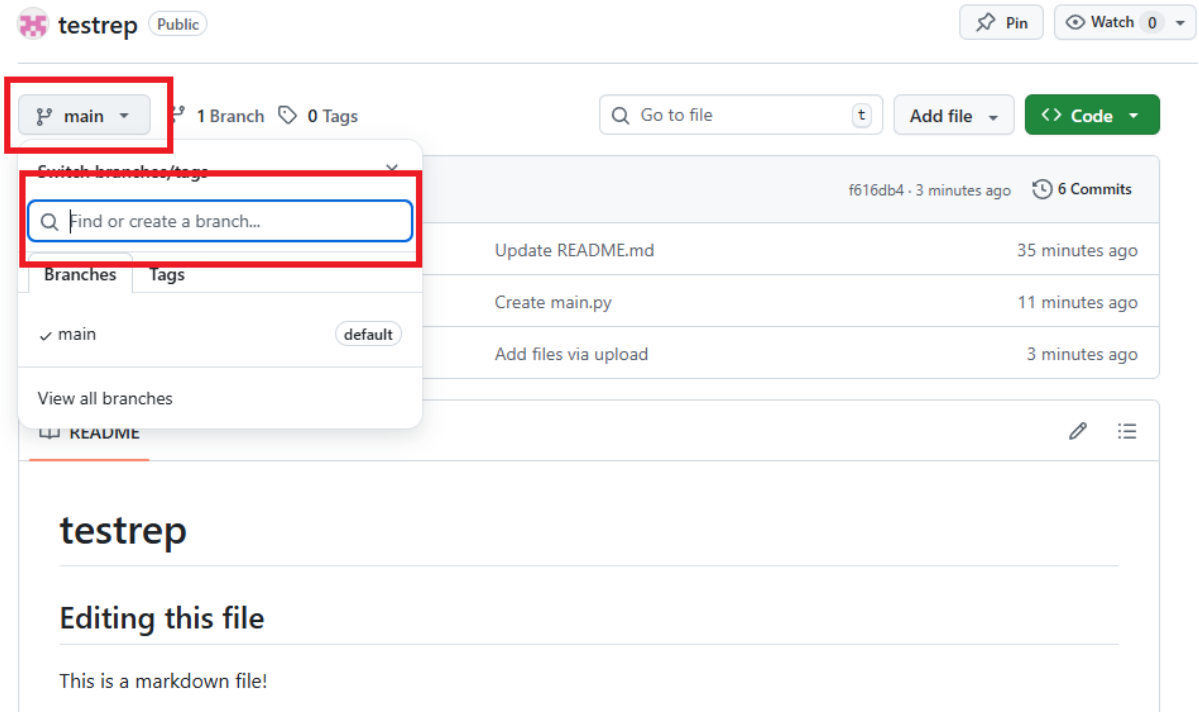
1. Creating a branch

You can create or delete branches directly on GitHub. Currently, there is one branch, as shown in the following image:

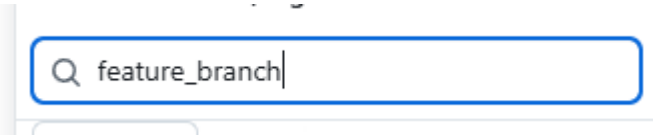


To add a branch, complete the following steps:

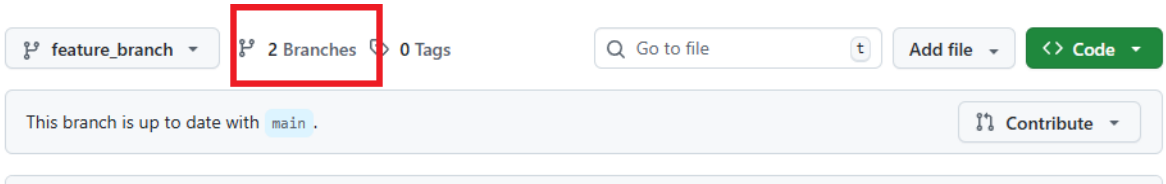
1. On GitHub, navigate to the main page of the repository.
2. Click on the `main` branch selector.



3. From the **Branch selector** menu, type `feature_branch` as the name of the branch you want to create and click **Create branch**.



4. Check to ensure your repository now has two branches.

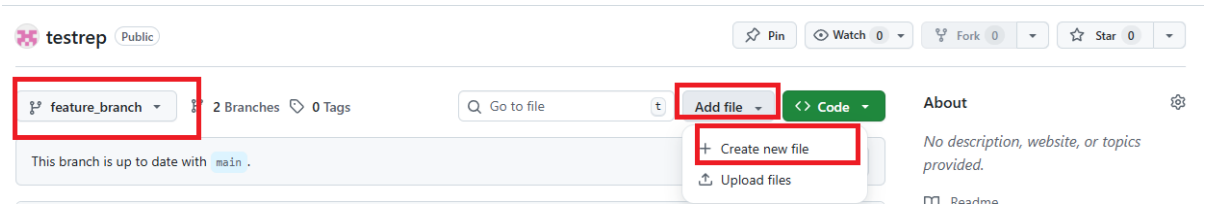


All files in the main branch have been copied to the new feature branch. However, a file added or edited in the feature branch is not *automatically* copied back up to the main branch.

2. Adding a file to the feature branch

To add a file to the feature branch, complete the following steps:

1. To create a file in the repository, click **Add file** and select **Create new file**.

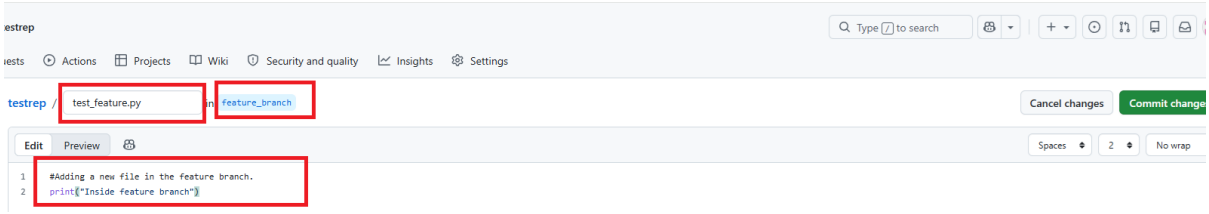


2. Enter the file name and extension; for example `test_feature.py`.

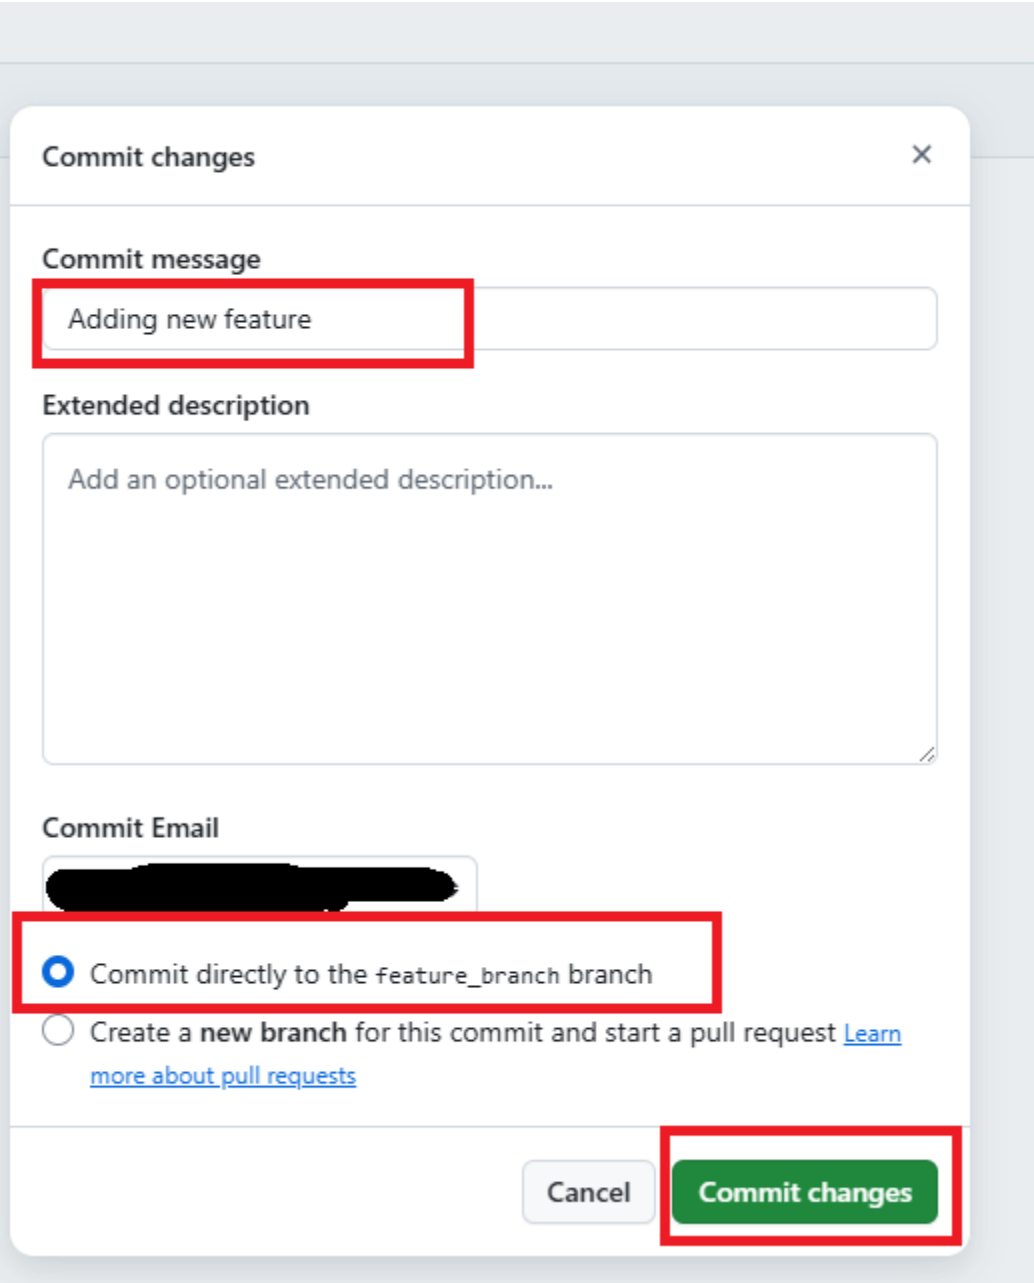
3. In the new file, add the following text:

```
## Adding a new file in the feature branch
print ("Inside feature branch")
```

Your file should look like the one in the following image:



4. Scroll down the page to the **Commit new file** panel, where you can add an optional description of the file. Select `Commit directly to the feature_branch branch.` and click **Commit new file**.



The file is added to the feature branch.

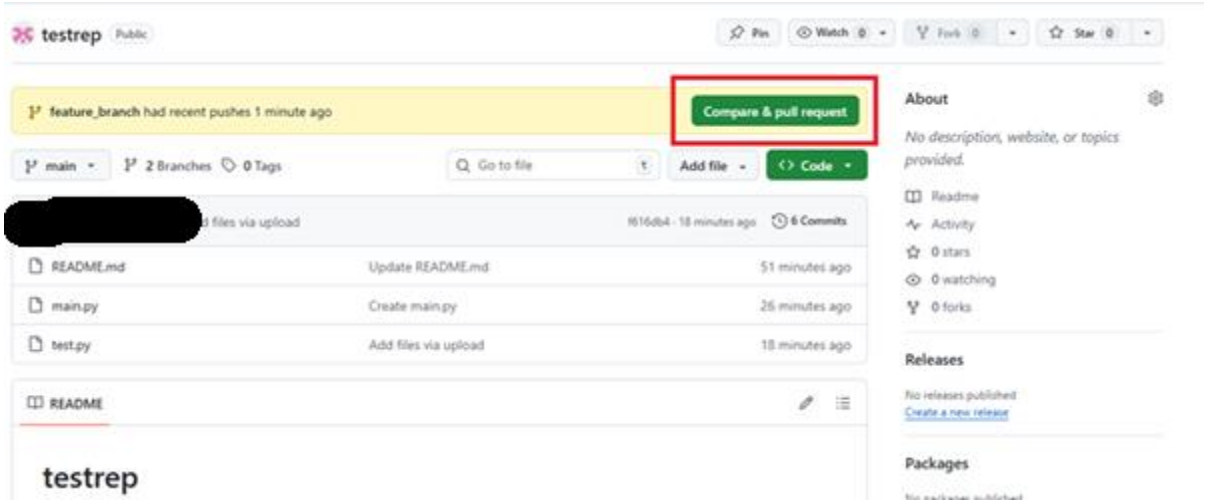
3. Open a pull request

As you learned earlier, changes in the feature branch are not automatically copied to the main branch. You can check this by using the **Branch selector** menu to view the main branch. You will see that there is no `test_feature.py` file.

Remember, in a collaboration environment it's always a good idea to have someone from the community review, approve, and merge your changes. That's what a pull request enables the project owner to do. When you create a pull request, you're requesting that project owners or administrators review the file that you want to add *before* it's pulled into the main project. Pull requests tell others about changes you've pushed to a branch in your remote repository on GitHub.

After you've made changes in a branch, you can compare branches to review the differences and then create a pull request:

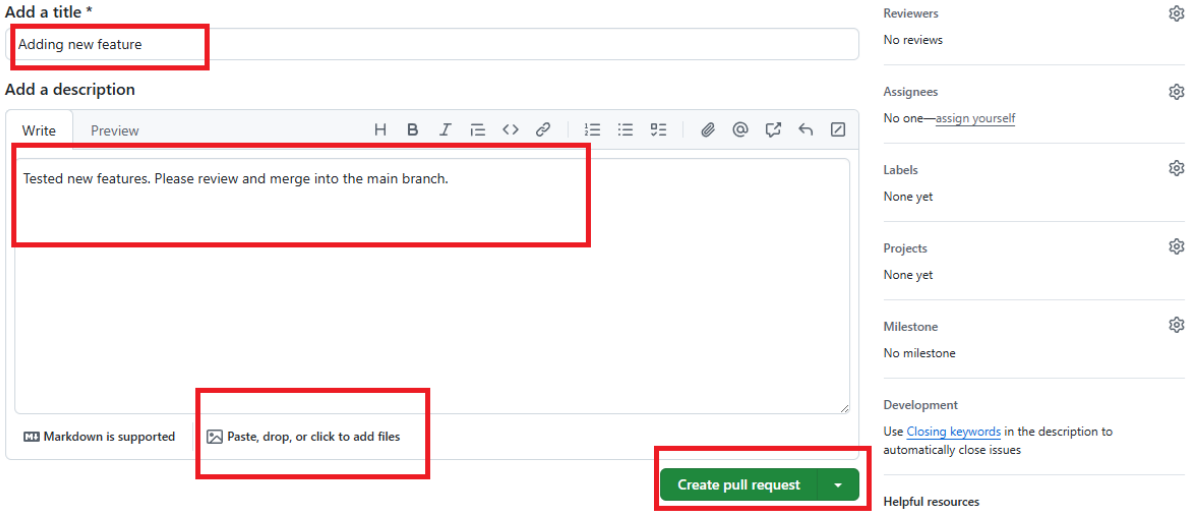
1. Click the **Compare & pull request** button.



2. Scroll to the bottom of the page. GitHub indicates that one file has been changed.

3. Scroll up to the **Open a pull request** panel and note that you are comparing changes across the two branches (see the image in step 4). The arrow from "feature branch" pointing to "main" indicates that you want your new file in the feature brunch "pulled" into the main branch.

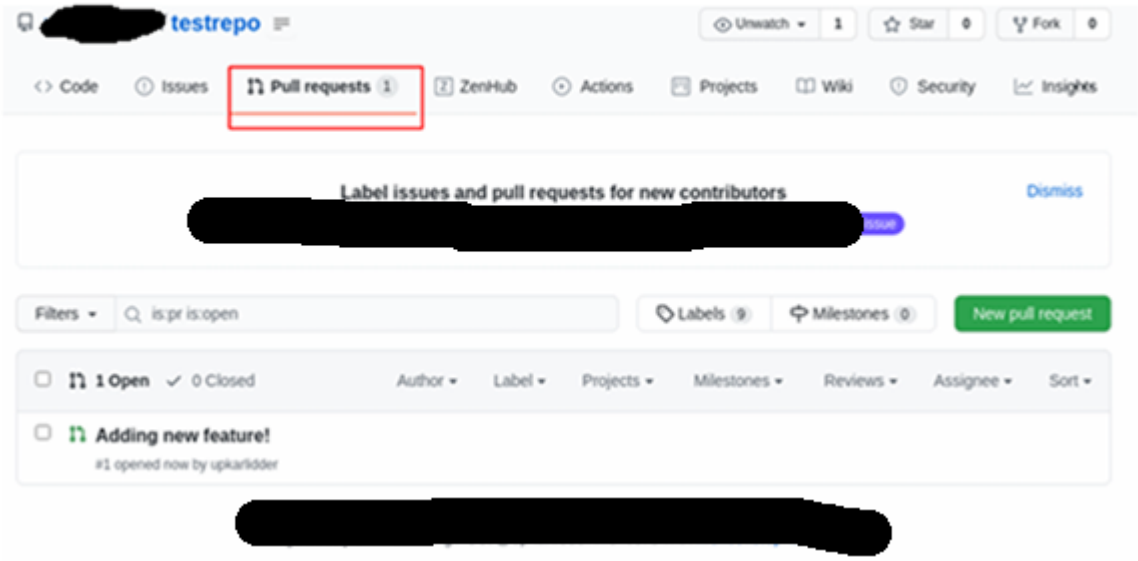
4. Add an optional description of your revision and click **Create pull request**.



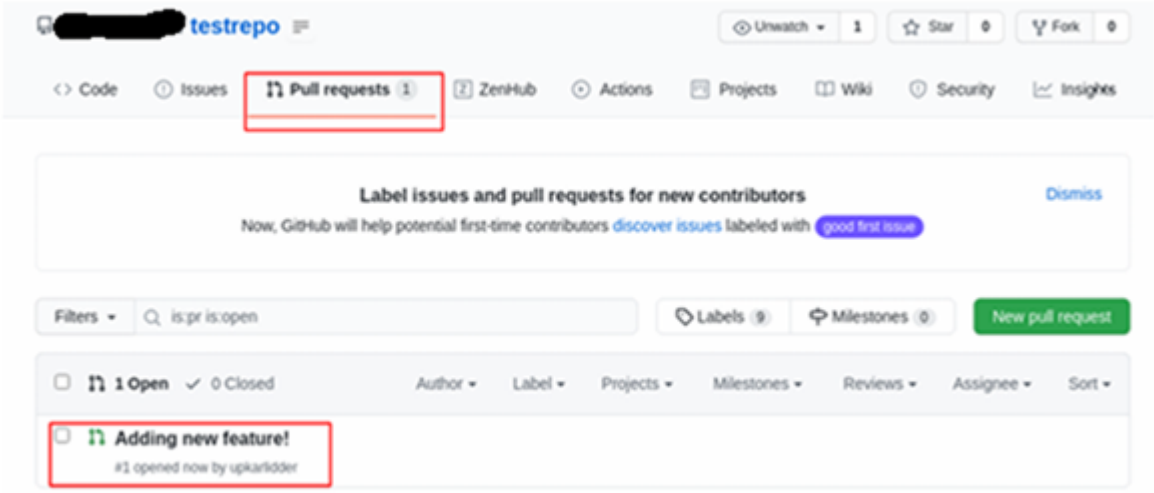
4. Merge the pull request

To add revisions from another branch into your project's main branch, you need to merge the pull request. Complete the following steps:

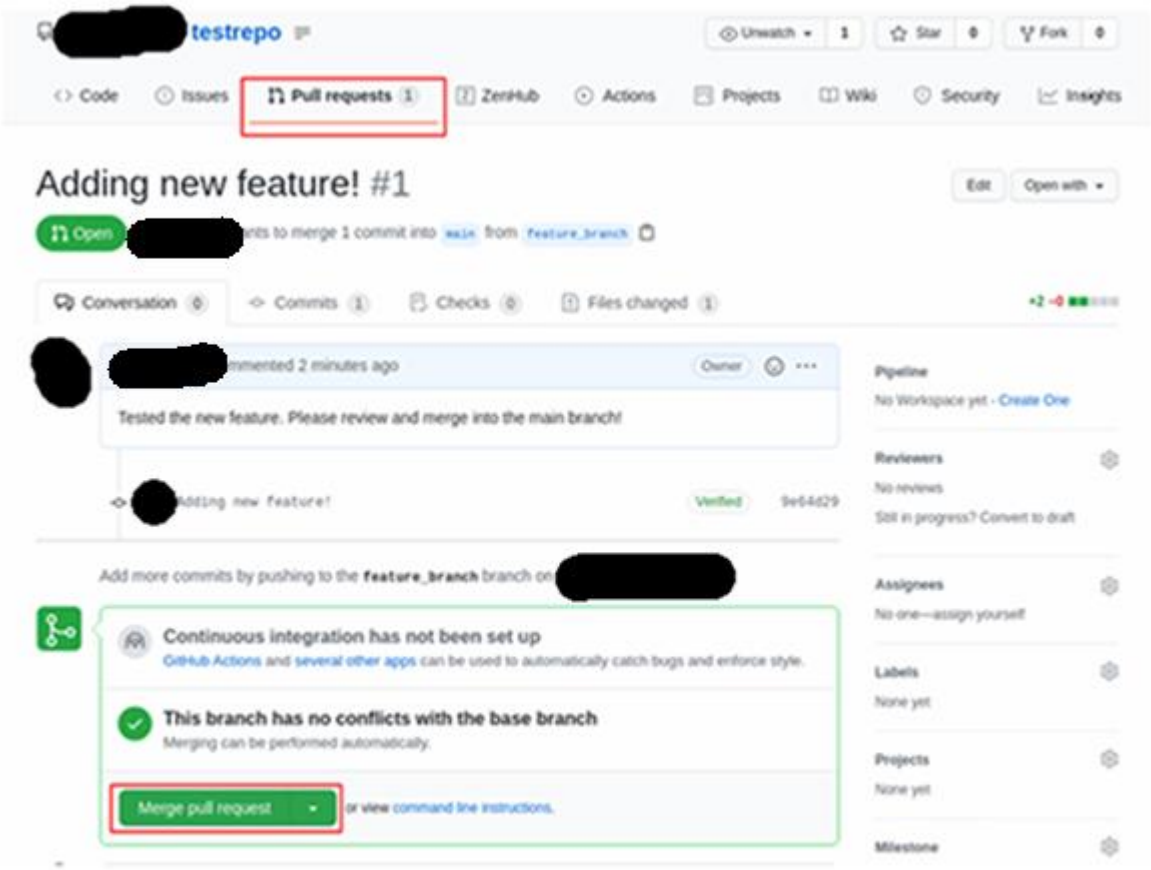
1. At the top of your repository page, click the **Pull requests** tab to see all pending pull requests.



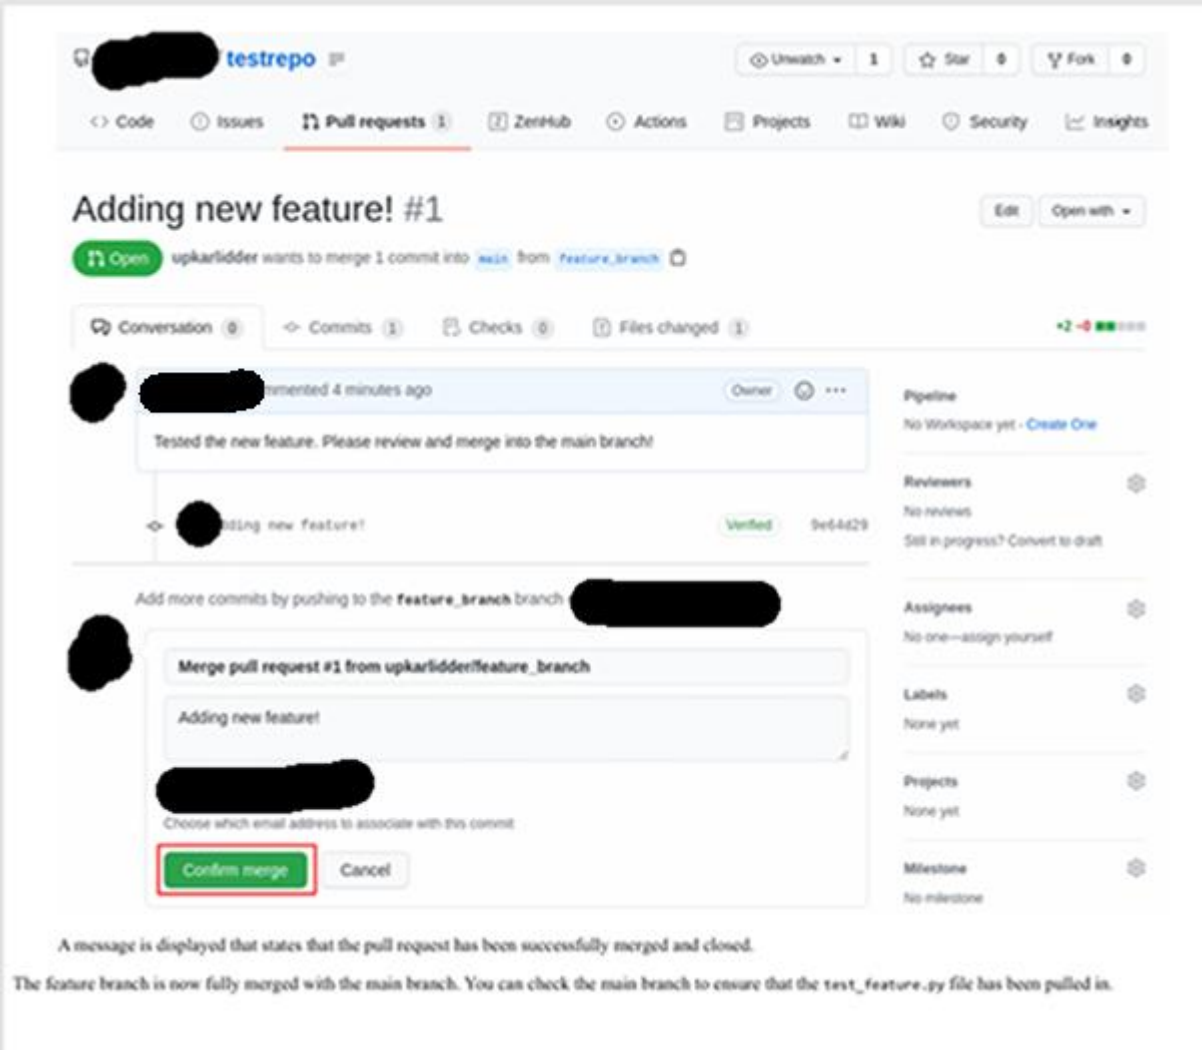
2. Click the pull request you created in the previous step.



3. You can click the commits to review the changes. You can optionally add a comment. If you are happy with the changes, click **Merge pull request** to accept the pull request.

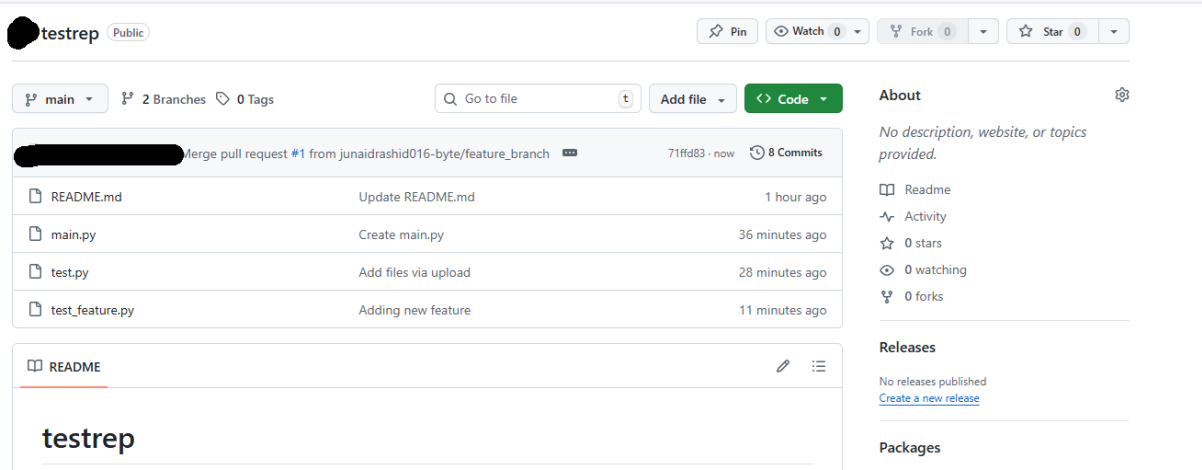


4. Click **Confirm merge** to merge the changes into your main branch.



A message is displayed that states that the pull request has been successfully merged and closed.

The feature branch is now fully merged with the main branch. You can check the main branch to ensure that the `test_feature.py` file has been pulled in.



You have learned how to create a branch, add and commit a file, open a pull request, and merge the pull request.
